Spot Process Separation Studio Can Separate It

From photographs, scans, Photoshop files, Corel Painter files, highly modeled illustrations and more, **Spot Process Separation Studio** (formerly known as Spot Process/VueRite) the first choice in screen printing separation software for tonal images.

Can it Really Be That Easy?

Yes! Open your art file (supports various file formats) and in just seconds **Spot Process Separation Studio** delivers screen-print friendly, color-separated channels. Match the on-screen spot process seps to your original file by using the built-in, targeted, editing and color-enhancement tools. Output the seps, go to press and expect great results.

Running **Spot Process Separation Studio** screen printing separation software and achieving outstanding results is simple and every shop can expect great results. From job one, you'll be sold on its ease of use and top-quality reproduction. And expect to save time and money: Start with a good, well-saturated art file and follow sound pre-press and press guidelines. You'll reduce product waste and shop downtime. From file prep to print order, and screen mesh counts to screen angles, we have worked it out so you can achieve the best prints your shop has ever produced.

Free Trial

Product features include:

Dynamic Under Base: An under base, the foundation of all screen printing on color garments, based on the color dynamics of the original image allowing for smooth color transitions and fades.

Three Black Options: Three levels of black giving users options with this critical element in color reproduction. These black options are not taken from limited CMYK conversions (an antiquated method) but are built directly from the original RGB.

Top White: An over-print white, critical in creating secondary and tertiary colors.

Color Enhancement: Orange and brown enhancement features for the hard-to-reach spectral values.

Color Merging: "Click of the mouse" color merging option allowing you to further reduce the already low number of channels.

NEW Multi-Format Support:** Open files (wide variety of popular formats) and spot process separates upon opening. Just color edit and output. Work with JPEGs, TIFFs, EPS files, PSD files, RGB and CMYK files just to name a few.

NEW Direct Selection Tools** (three marquis shape options): For targeted color adjustments to separated channels. This advanced feature delivers greater control and superior results.

NEW Saturate and Desaturate** (droplet and sponge icons): Targeted and universal color saturation control to darken or lighten existing channel data.

NEW Eraser Tool** (pencil eraser icon): Eliminate unwanted channel data quickly and easily. No need to bring separations into an image editing application like Photoshop to make edits.
